Identifying specific binding agents for substrate binding site in CCT chaperonin complex - also new peptide binding agents and their mimetics, and peptides containing a specific CCT binding site, used for treating

Disclosure, Fig 10; 97pp; English.

This invention describes a method which uses the CCT (eukaryotic type II chaperonin) complex or part of it, for identifying a binding agent that can occupy a substrace-binding site (SBS) on the CCT complex. By binding act to the CCT complex, the binding agents block an SBS so that biological activity of the CCT complex is affected, particularly its ability to fold substrates such as actin, tubulin and cyclin. The binding agents are useful for treatment of cancer, particularly when used in combination with an anticancer drug, or viral infections. Nucleic acid fragments are used to screen for agents, e.g. binding agents that modulate interaction between the CCT complex and a protein that is to be folded. The binding

                                                                                                                                       Gaps
agents may target cells that are actively synthesising tubulin etc. (unlike known microtubule-stabilising agents that affect all cells) should have reduced toxicity for normal cells. AAW92527-W92541 are peptide substrates used in the method of the invention

useful in the prevention, treatment and diagnosis of cancer (e.g. ovarian cancer), immune disorders, cardiovascular disorders and neurological Isolated nucleic acid molecules encoding novel ovarian polypeptides, diseases.

Claim 11; SEQ ID NO 3601; 2922pp; English.

The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP43228) and to cDNAs encoding them (ABQ54131-ABQ56305), and also encompasses polypeptides 90% identical and polymucleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host calls comprising human ovarian antigens to polymucleotides against human ovarian antigens and the use of ovarian antigens on preventing various ovary and/or breast related treating, prognosing or preventing various ovary and/or breast cancer, and metastatic tunnurs of ovarian or breast origin, reproductive system disorders (e.g., infertinity, disorders origin, reproductive system disorders (e.g., infertinity, disorders origin, reproductive system disorders (e.g., inflammatory conditions (e.g., mastitis, oophoritis and consistence), immune disorders (e.g., congenital and acquired shock syndrome), inflammatory conditions (e.g., mastitis, oophoritis and various ovarian disorders (e.g., anaemia), cardiovascular disorders, inconders (e.g., anaemia), cardiovascular disorders and urinary system disorders. Ovarian antigen polypeptides and polymucleotides may also be used in screening for compounds which modulate ovarian antigen expression or activity. The polymucleotides may further be used for gene therapy, chromosome mapping, in the modulate ovarian antigen expression or activity. The polymucleotides may else used an inference or polypeptides may be used as food additives or to prepare antibodies useful in disease disposis, drug targeting and phenotyping. The present useful in disease diagnosis, drug targeting and phenotyping. The present sequence represents a human ovarian antigen of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO ftp.wipo.int/pub/published_pct_sequences

Identifying specific binding agents for substrate binding site in CCT chaperonin complex - also new peptide binding agents and their mimetics, and peptides containing a specific CCT binding site, used for treating cancer.

Disclosure; Fig 10; 97pp; English.

This invention describes a method which uses the CCT (eukaryotic type II chaperonin) complex or part of it, for identifying a binding agent that can occupy a substrate-binding site (SBS) on the CCT complex. By binding to the CCT complex, the binding agents block an SBS so that biological activity of the CCT complex is affected, particularly its ability to fold substrates such as actin, tubulin and cyclin. The binding agents are useful for treatment of cancer, particularly when used in combination with an anticancer drug, or viral infections. Nucleic acid fragments are used to screen for agents, e.g. binding agents that modulate interaction between the CCT complex and a protein that is to be folded. The binding

These comprises a nucleic acid sequence encoding any of the 167 amino acid sequences (e.g. 438, 237 or 233 amino acids) fully defined in the capteride sequences (e.g. 4798, 1949 or 1691 bp) fully defined in the specification (SEQ. ID NOS: ADP81095 to ADP81261) and comprises any of the 128 nucleotide sequences (e.g. 4798, 1949 or 1691 bp) fully defined in the specification (SEQ. ID NOS: ADP80967 to ADP81094). The invention in the specification (SEQ. ID NOS: ADP80967 to ADP81094). The invention further comprises: a method for determining the presence of a ovarian specific nucleic acid molecule; a host cell comprising the vector, a method for producing a polypeptide encoded by the above nucleic acid molecule; a polypeptide encoded by the nucleic acid molecule; a polypeptide encoded by the nucleic acid molecule; an enthod for determining the presence of an ovarian specific protein in a sample; a method for diagnosing or monitoring the presence and metastases of or ovarian cancer in a patient, a kit for detecting a risk of cancer or correct of the above nucleic acid molecule or
                                                                                                                                                                                                             ö
                 (unlike known microtubule-stabilising agents that affect all cells), so should have reduced toxicity for normal cells. AAM92527-W92541 are peptide substrates used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New ovarian specific nucleic acid molecules and polypeptides useful for diagnosing, preventing or treating ovarian cancer, for producing transgenic animals or cells, or for research purposes.

The invention relates to isolated polynucleotide (I) and polypeptide (II)

sequences. (I) is useful as hybridisation probes, polymerase chain

caction (PCR) primers, oligomers, and for thromesome and gene mapping,

and in recombinant production of (II). The polynucleotides are also used

in diagnostics as expressed sequence tags for identifying expressed

genes. (I) is useful in gene therapy techniques to restore normal

activity of (II) or to treat disease states involving (II). (II) is

useful for generating antibodies against it, detecting or quantitating a

cusclul for generating antibodies against it, detecting or quantitating a

polypeptide in tissue, as molecular weight markers and as a food

supplement. (II) and its binding partners are useful in medical imaging

of sites expressing (II). (I) and (II) are useful for treating disorders

involving aberrant protein expression or biological activity. The

polypeptide and polynucleotide sequences have applications in

diagnostics, forensics, gene mapping, identification of mutations

responsible for genetic disorders or other traits to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
polypeptide; a method of treating a patient with ovarian cancer; and a vaccine comprising the above polypeptide or nucleic acid encoding the polypeptide. The isolated nucleic acid molecules and polypeptides have cytostatic activity. The isolated polypeptides may be used to create a vaccine. The isolated nucleic acid molecules and polypeptides can be used co diagnosing or monitoring the presence and metastases of ovarian cancer and treating ovarian cancer. This sequence represents the protein of an ovarian specific gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, chromosome mapping, gene mapping, gene therapy, forensic, food supplement, medical imaging, diagnostic, genetic disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP41228) and to cDNAs encoding them (ABQ54131-ABQ56305), and also encompasses polypeptides 90% identical and polymucleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen polymucleotides, antibodies against human ovarian antigens, and the use of ovarian antigen polymucleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related disorders. Such conditions include ovarian cancer and breast cancer, and metastatic tumours of ovarian or breast origin, reproductive system
and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pct_sequences

disorders (e.g., infertility, disorders of pregnancy, anovulation, colycystic ovary syndrome, ovarian cysts, and dysmenorrhoea), endocrine disorders, infertions (e.g., chlamydia, HV, toxoplasmosis, and toxic shock syndrome), inflammatory conditions (e.g., mastitis, oophoritis and cypic immunodeficiencies, autoimmune oophoritis, systemic lupus erythematosus), communodeficiencies, autoimmune oophoritis, systemic lupus erythematosus), chlood-related disorders (e.g., anamia), cardiovascular disorders.

CC respiratory disorders, neurological disorders, gastrointestinal disorders and urinary system disorders. Ovarian antigen polypeptides and compute ovarian antigen be used in screening for compounds which modulate ovarian antigen be used in screening for compounds which continues be used for gene therapy, chromosome mapping, in the citerther be used for gene therapy, chromosome mapping, in the collection of individuals and in forensic analysis, and the collection of individuals and in forensic analysis, and the collection of individuals and in forensic analysis. The present sequence represents a human ovarian antigen of the invention. Note: The sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Compositions and methods for the detection of hematological malignancies,

                                                                                                                          present sequence is the protein sequence of a human haematological malignancy related antigen. The methods of the present invention comprise detecting the presence of haematological malignancy related antigen (s) in a sample obtained from the patient (an increased level of the polypeptide, compared to an unaffected individual, is indicative of an increased risk). Haematological malignancies which can be treated using the present invention are chronic lymphocytic leukaemia, lymphoma, follicular lymphoma, hodgkin's lymphoma, non-Hodgkin's lymphoma and T/B cell non-Hodgkin's lymphoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acids encoding a range of human polypeptides, useful in genetic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP41228) and to cDMAs encoding them (ABD44131-ABD56305), and also encompasses polypeptides 90% identical and polynucleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen polynucleotides, antibodies against human ovarian antigens, and the use of ovarian antigen polynucleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related
to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation; to regulate haematopoiesis; and in bone, cartilage, tendor
                                                                                                                                                                                                                                                       Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               useful in the prevention, treatment and diagnosis of cancer (e.g. ov. cancer), immune disorders, cardiovascular disorders and neurological diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Isolated nucleic acid molecules encoding novel ovarian polypeptides,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ovarian antigen; ovary; ovarian; breast; cancer; tumour;

disorders .ucc conditions include Ovarian cancer and Dreast Cancer, and metastatic tumours of ovarian or breast origin, reproductive system disorders (e.g., infertility, disorders of pregnancy, anovulation, colorycatic ovary syndrome, ovarian cysts, and dymemorrhoes), endocrine disorders infections (e.g., chlamydia, HIV, toxoplasmosis, and toxic shock syndrome), inflammatory conditions (e.g., mastitis, oophoritis and vaginitis), immune disorders (e.g., congenital and acquired immunodeficiencies, autoimmune oophoritis, systemic lupus erythematosus), blood-related disorders (e.g., anaemia), cardiovascular disorders and unimary system disorders. Ovarian antigen polypeptides and polymucleotides may also be used in screening for compounds which collustication of individuals and in forensic analysis, and the identification of individuals and in forensic analysis, and the sequence represents a human ovarian antigen of the invention.                                                                                                     The present invention relates to compositions and methods for the detection, diagnosis and therapy of haematological malignancies. The present sequence is the protein sequence of a human haematological malignancy related antigen. The methods of the present invention comprise detecting the presence of haematological malignancy related antigen(s) in a sample obtained from the patient (an increased level of the polypeptide, compared to an unaffected individual, is indicative of an increased risk). Haematological malignancies which can be treated using the present invention are chronic lymphocytic leukaemia, lymphoma, follicular lymphoma, non-Hodgkin's lymphoma and T/B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Compositions and methods for the detection of hematological malignancies, e.g. chronic lymphocytic leukemia, lymphoma, follicular lymphoma and

                                                      The present invention relates to compositions and methods for the detection, diagnosis and therapy of haematological malignancies. The present sequence is the protein sequence of a human haematological malignancy related antigen. The methods of the present invention comprise detecting the presence of haematological malignancy related antigen (8) in sample obtained from the patient (an increased level of the polypeptide, compared to an unaffected individual, is indicative of an increased risk). Haematological malignancies which can be treated using the present invention are chronic lymphocytic leukaemia, lymphoma, follicular lymphoma, Hodgkin's lymphoma, non-Hodgkin's lymphoma and T/B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Compositions and methods for the detection of hematological malignancies, e.g. chronic lymphocytic leukemia, lymphoma, follicular lymphoma and Hodgkin's and T/B cell non-Hodgkin's lymphoma.
                                                                                                                                                                                                                                                                                                      Gaps

The present invention relates to compositions and methods for the detection, diagnosis and therapy of haematological malignancies. The present sequence is the protein sequence of a human haematological malignancy related antigen. The methods of the present invention comprise detecting the presence of haematological malignancy related antigen (8) in sample obtained from the patient (an increased level of the polypeptide, compared to an unaffected individual, is indicative of an increased risk). Haematological malignancies which can be treated using follicular lymphoma, Hodgkin's lymphoma, non-Hodgkin's lymphoma and T/B cell non-Hodgkin's lymphoma and T/B
                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             associated (CA) nucleic acids encoding them. The invention also relates to a method for treating cancers involving administering to a patient an inhibitor of CAP, and a method of screening for anticancer activity in a potential drug involving providing a cell that expresses a CA gene, contacting a tissue sample derived from a cancer cell with an anticancer drug candidate and monitoring the effect of the anticancer drug candidate on expression of the CA gene. The CAP proteins are useful for detecting and for screening for a bioactive agent capable of modulating the activity of a CAP protein in a test cell sample and for screening for a bioactive agent capable of modulating the activity of a CAP protein. The CA nucleic acids are useful for diagnosing cancer, involving determining the expression of a CA nucleic acid in a tissue. This sequence represents a human CAP of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel human cancer associated protein encoded within open reading frame of cancer associated gene, useful as targets for diagnosing cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain recardion (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal crivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving abberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess blodiversity represent cold sequences. Aggonolo-Abg30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this pattent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at (ftp. wipo.int/pub/published_pot_esservers)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cytostatic; Anti-inflammatory; Osteopathic; Neuroprotective; Nootropic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polynucleotides encoding full-length polypeptides, e.g. secretory and/or membrane proteins, useful for developing medicines for disease which the gene is involved, or as target molecules for gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to novel human secretory or membrane proteins (ADA54072-ADA55710) and their coding sequences (ADA52433-ADA54071). The coding sequences are useful in the gene therapy of diseases caused by abnormalities of the proteins, e.g. cancer, inflammatory diseases, osteoporosis or neurological disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gene Therapy; human; secretory protein; membrane proteins; cancer; inflammatory disease; osteoporosis; neurological disease.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGR) primers, oligomers, and for chomosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving abbarrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in the vival out. Every man obtained in the printed specification, but was obtained in the vival.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.

New complex between two interacting proteins in adipocyte cells, useful for identifying selected interacting domains that modulate protein interactions, or for preventing or treating metabolic disorders such as

Claim 6; Page 167; 382pp; English.

obesity or diabetes

```
The invention relates to a complex between two interacting proteins in adipocyte cells, given in the specification. The proteins are identified by selected a bait protein from a known adipocyte marker and then performing a yeast 2-hybrid selection to isolate prey proteins encoded by correct companies of an adipocyte cDNA library. The proteins are designated SID (RTW) (selected interacting domains) proteins. Also included are a polymetheotide encoding a polypeptide in the adipocyte cells, a compinent host cell expressing at least one of the interacting cells, a recombinant host cell expressing at least one of the interacting cells, a sID (RTW) polypeptide comprising any of the 738 amino acid sequences given in the specification (including its fragment or variant), a vector cells, a SID (RTW) polymelectide, and its fragment or variant), a vector comprising the SID (RTW) polymuclectide, a recombinant host cell comprising the vector, a protein chip comprising the polypeptides and a recombinant host cell comprising all or part of the data, listed in the specification. The complex, polymelectides are useful for preventing or treating metabolic disorders such as obesity or diabetes. The polymuclectides are useful for preventing or treating metabolic disorders such as obesity or diabetes. CT the polymuclectides are useful for identifying selected interaction thus particularly useful for identifying selected interaction thus certains the therapeutic effect. The present sequence represents a SID (Arrw), protein of the data sequence represents a SID (Arrw) and the second of the sequence represents a SID (Arrw) and the sequence of the sequence represents a SID (Arrw) and the sequence of the sequence represents a SID (Arrw) and the sequence of the sequence represents a SID (Arrw) and the sequence of the sequence of the sequence represents a SID (Arrw) and the sequence of the sequenc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Seguence 1110,

Sequence 731, Application US/09976594

Patent No. 6673549

GENERAL INFORMATION:
APPLICANT: Furness, Michael
APPLICANT: Buchbinder, Jenny
TITLE OF INVENTION: GENES EXPRESSED IN C3A LIVER CELL CULTURES TREATED WITH STEROIDS
FILE REPERBNCE: PA-0041 US
CURRENT FILLING DATE: 2001-10-12
PRIOR PILING DATE: 2000-10-12
PRIOR FILING DATE: 2000-10-12
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             US-09-976-594-731

Patent No. 681239

GENERAL INFORMATION:

APPLICANT: VENTER, J. Craig et al.

TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF;

TITLE OF INVENTION: WINDER: US/09/949,016

CURRENT APPLICATION NUMBER: 60/241,755

PRIOR PLILNG DATE: 2000-10-20

PRIOR PLILNG DATE: 2000-10-03

SEQ ID NOS: 207012

SEQ ID NO 7721

LENGTH: 386
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       100.0%; Score 80; DB 4; Length 386; 100.0%; Pred.
